Case Author

Khanh Lam

Principal Value Advisor at SAP

With 7+ years across SaaS, consulting, and customer strategy, Khanh partners with global enterprise leaders to turn digital transformation initiatives into measurable value. He specializes in executive advisory and change enablement, bridging the gap between product strategy and sustained client outcomes.

About SAP

Company Overview

SAP is the world's leading provider of enterprise application software, helping organizations run their core business operations across finance, supply chain, procurement, HR, and customer experience. With 440,000+ customers in over 180 countries, SAP's software underpins a significant share of global commerce.

AI Strategy

In 2026, SAP is deeply invested in bringing AI into the heart of enterprise workflows through Joule, its AI copilot embedded across SAP's product suite. SAP's broader vision, the Autonomous Enterprise, is about transforming enterprise software from a system that records what happened into one that helps businesses sense, decide, and act in real time.

Problem Space

Market Dynamics and the Intelligence Gap

Retail is one of the industries where the gap between data and decision-making is most costly. Consumer demand shifts faster than ever, supply chains remain volatile, and the margin for error is thin. Retailers collect enormous amounts of data across stores, e-commerce platforms, suppliers, and logistics networks, but turning that data into timely, confident action remains a fundamental challenge.

At the same time, AI is rapidly moving from experimentation into retail operations. The question is no longer whether AI belongs in retail, but how to integrate it in a way that genuinely improves how teams work, earn customer trust, and stay resilient when conditions change unexpectedly.

Human Decision-Making Under Pressure

The users at the centre of this space are the people running retail operations day to day: merchandising managers balancing inventory across channels, supply chain planners responding to disruptions, and store teams trying to deliver consistent experiences under pressure. These are decision-makers with real accountability, working with imperfect information and limited time.

Challenge Statement

How might SAP help retailers close the gap between when demand shifts and when the business responds?

Teams are encouraged to interpret this challenge broadly. The problem space spans inventory management, supply chain coordination, in-store operations, customer experience, and more. Strong solutions will identify a specific user and problem, develop a well-reasoned product concept, and articulate the value it creates for both the retailer and their customers.

Things to Think About

Retail Context & Business Value

What specific challenges do retailers face, and how would your solution create measurable value for the business and its customers?

SAP's Role & Capabilities

How could your solution fit within SAP's broader enterprise ecosystem and help retailers turn data into actionable decisions?

AI, Automation & Risk

Where could AI or automation improve decision-making, and where is human oversight still important? What potential risks or trade-offs should be considered?
