

SAP and Aritzia · Product Pitch Brief

Atelier, by Joule

Powered by SAP Joule, made for Aritzia.
Ear-piece software that streamlines fitting room and floor operations by voice, and turns every hand-off into actionable insights.

Product+ 2026 · Project Brief · October 2026

01 Project Summary

Atelier, by Joule, is a new software that enhances the current retrieval process between atelier operations and boutique associates at Aritzia.
Powered by SAP's Joule AI, for Aritzia.

Programmed onto existing earpieces at Aritzia, *Atelier, by Joule* will allow for improved efficiency between atelier operators (AO), who manage logistics in change rooms, and boutique associates (BA), who retrieve and return inventory from the floor.

Before *Atelier, by Joule*
Employees use a Clientele Matching Tool (CMT) to place retrieval requests and check inventory. However, the app requires manual refreshing, and for an employee's hands to be free.

With *Atelier, by Joule*
Atelier, by Joule allows associates to make requests through voice-activated channels, get instant inventory answers in voice mode, and talk to each other anywhere on the floor.

Each request will also capture anonymized fitting-room data, such as items that are often tried on but rarely bought. These are behavioural insights that sales and inventory data alone can't reveal, that sync with SAP Business Data Cloud.

02 The Problem

Problem Statement

How might we help atelier operations and boutique associates at Aritzia communicate retrieval requests to each other instantly, to ensure store operations remain efficient when demands shift?

Retrievals are queued through the Clientele Matching Tool (CMT), which does not notify associates when a new request is added. Employees prefer to skip the app entirely, and call requests out loud.

Pain Point 1
No retrieval alerts
CMT sends no notifications. Runners only see a request by manually refreshing their app.

Pain Point 2
Hands are never free
Retrieving items and helping customers makes it impossible to constantly check for updates.

Pain Point 3
Human nuance is lost
Follow-up questions and item substitutes are difficult to communicate are lost through CMT.

Pain Point 4
Customer insights are forgotten
Some insights, such as how often clients try on but not purchase an item, are not recorded.

03 User Research

We interviewed three Aritzia store associates about their satisfaction with the current retrieval process using CMT.

> *"There are no notifications unless you manually refresh. During peak, we skip using the CMT app entirely, just to speed up retrieving."*
> —Anonymous Aritzia employee, on their store's curren retrieval flow

- **The hand-off is the problem.** Friction exists when a request from atelier is handed-off to the floor.
- **Previous use of earphones was too overwhelming.** Fifteen associates shouting over each other for their customer's item request is what caused Aritzia to pivot to retrieval requests on an app.
- **Employees only have two hands.** Runners often have several items in their hands at all time. They don't have capacity to check their screen, but they can hear still hear verbal requests.
- **Asking a human feels better.** Asking a real person feels more efficient than sending in a request.

04 Target Users

Atelier Operations (AO)
The employees managing change rooms. They send retrieval requests for customers.

Boutique Associates (BA)
The employees retrieving requests and running unwanted items for customers.

05 User Segmentation

Why do we focus on Aritzia?

Aritzia is a long-term SAP partner with strong potential for continued business growth

- **Aritzia is one of the fastest growing fashion companies.** Aritzia achieved a record $1.2 billion in the fourth quarter of Fiscal 2026, a 33% increase from the previous year.
- **Long term partner with SAP.** Aritzia has been partnering with SAP for over a decade. Source
- **US Expansion.** Aritzia's US revenue increased 37.8% to $755.3 million, comprising 63.7% of net revenue, and plans to open 11-12 new stores in the States in the upcoming fiscal year (March 2027)

06 Product Features

With *Atelier by Joule,* employees can make audible requests for stock retrieval or checks, without having to constantly check their CMT. Data collected from these requests will be used to inform future supply-chain decisions.

Voice-command activated channels
"Hey Joule, connect me to the boutique associate."
Use voice-activated commands to talk to the specific person you need.

Ask for an instant inventory check
"Hey Joule, do we have a black shirt in a size 4?"
Check stock on floor, in back, nearby stores and online through a voice command.

Extract user data to improve products
"Six people tried that on today, but no one bought it."
Earpieces collect anonymized product data that sync with SAP Business Data Cloud.

07 Why It Wins

Research-backed positioning

SAP already has the tools, *Atelier* captures the information. Aritzia already operates on a S/4HANA backend making a connection with Joule seamless.

SAP product	What *Atelier, by Joule* adds
Joule + Joule Studio	Voice-activated custom routing agent (partnered with Live Kit)
Business Data Cloud	Anonymized customer and product data for Retail Intelligence
Analytics Cloud	Hand-off and store demand dashboards (data visualization)
S/4HANA	Live stock answers, timed with Aritzia's ECC → S/4 move
SAP BTP	Reusable app for any associate-led retailer

For SAP
Recurring revenue
A Joule extension on SAP BTP, priced per store or associate, is a constant stream of revenue.

Competitive Edge
Two birds, one stone
Improving communication is critical, but we also implement a new way to collect user data.

For Aritzia
No new hardware
Runs on existing earpieces and CMT. Aritzia's many apps also already run on SAP.

ARITZIA

Why Aritzia?

$1.2B+

record Q4 Fiscal 2026 revenue. One of fashion's fastest-growing retailers, and also a local Vancouver brand.

10+ yrs
SAP partner

S/4HANA
Joule-ready backend

Value Proposition
Why Joule AI and SAP?

- **On SAP since 2008.** Aritzia runs SAP ERP and SAP for Retail tools, and CMT is built on SAP.
- **No costly migration.** Staying on SAP avoids re-platforming and retraining, and Atelier rides Aritzia's planned move to S/4HANA.
- **Their data is already here.** Inventory, client and sales data live in SAP, so Joule can answer from day one. A rival like Theatro would need new integrations.

By the numbers
Why the store hand-off matters

85%
of North American store associates say real-time inventory stock visibility tools can boost their efficiency and customer service
Zebra Global Shopper Study

376 hrs
lost per frontline worker each year to poor information access, searching and rework.
Unily & ScreenCloud (800 workers)

71%
of frontline workers rely on personal devices or unsanctioned apps — like CMT on associates' own phones.
Unily & ScreenCloud

$80.6B
yearly cost of frontline friction due to employees missing critical information and losing time.
IHL Group, 2026

20%
of non-purchasers are less likely to return within three weeks after leaving without buying.
SMG

Our biggest advantage
Fitting-room demand data no competitor has.
Voice wearables stop at communication. With our product, each try-on, reject or missed-size becomes important data that informs existing databases, that are already powered by SAP.

Market research
Closest competitors
Voice-activated software for retail headsets earpieces.

Voice transmission, ability to check stock, and ability to transmit data to external systems.

08 Success KPIs

Speed of retrieval process ★ North Star
Core handoff speed, two weeks after implementation. Measure efficiency of headset software, a month after implementation.

Voice channel switching accuracy
Percent accuracy that voice channel is switched correctly. Measure accuracy of voice command and word recognition

Stock check accuracy
Percent of stock checks that gave an accurate report a month after implementation. Measure accuracy of instant stock checks

Inventory management
Percent of stock-outs and overstocks a couple months after implementation. Measure usefulness of collected data
